Absolute Paths Study Guide

CHSAbsolutePath / Docs / study_guide.pdf

Relative path vs. absolute path

	Relative path	Absolute path (full web address)
Starts from	The file you are writing in	The root of a website on the internet
Example	`Images/cat.png`	`https://chsabsolutepath.netlify.app/Images/cat.png`
Works from	Pages inside the same site	Any page, anywhere
Practice it in	Route 404	This site

The three parts of a full address

```
https://chsabsolutepath.netlify.app/Images/Pets/my_dog.gif
```

- **Site root** `https://` + the domain + `/`. It stands for the CHSAbsolutePath folder.
- **Folders** every folder from the root down to the file, each followed by `/`.
- **File name** the exact name, including its extension.

Build one in three steps

1. Find the file on the site map.
2. Start with the site root: `https://chsabsolutepath.netlify.app/`
3. Add each folder on the way to the file, then the file name.

Common mistakes

Mistake	Wrong	Fix
Typing the top folder's name	`…app/CHSAbsolutePath/Images/cat.png`	The site root already means that folder. Leave it out.
Skipping a folder	`…app/my_dog.gif`	Name every folder: `…app/Images/Pets/my_dog.gif`
Wrong capitals	`…app/images/cat.png`	Copy the capitals exactly from the map.
No extension	`…app/Images/cat`	End with the extension, like `.png`
A path from your computer	`C:/Users/…/cat.png`	Nobody else can see your computer. Use the web address.
Backslashes	`Images\cat.png`	Web addresses use forward slashes: `/`

Check yourself

1. Write the full address for `star.svg`. It is in Assets, inside Icons.
2. What is wrong with `https://chsabsolutepath.netlify.app/Styles/Theme.css`?
3. Why does a page on your computer need the full address instead of `Images/cat.png`?

Answers: (1) https://chsabsolutepath.netlify.app/Assets/Icons/star.svg (2) The file is theme.css with a lowercase t. (3) A relative path starts from your page's own folder on your computer, and the file isn't there.
